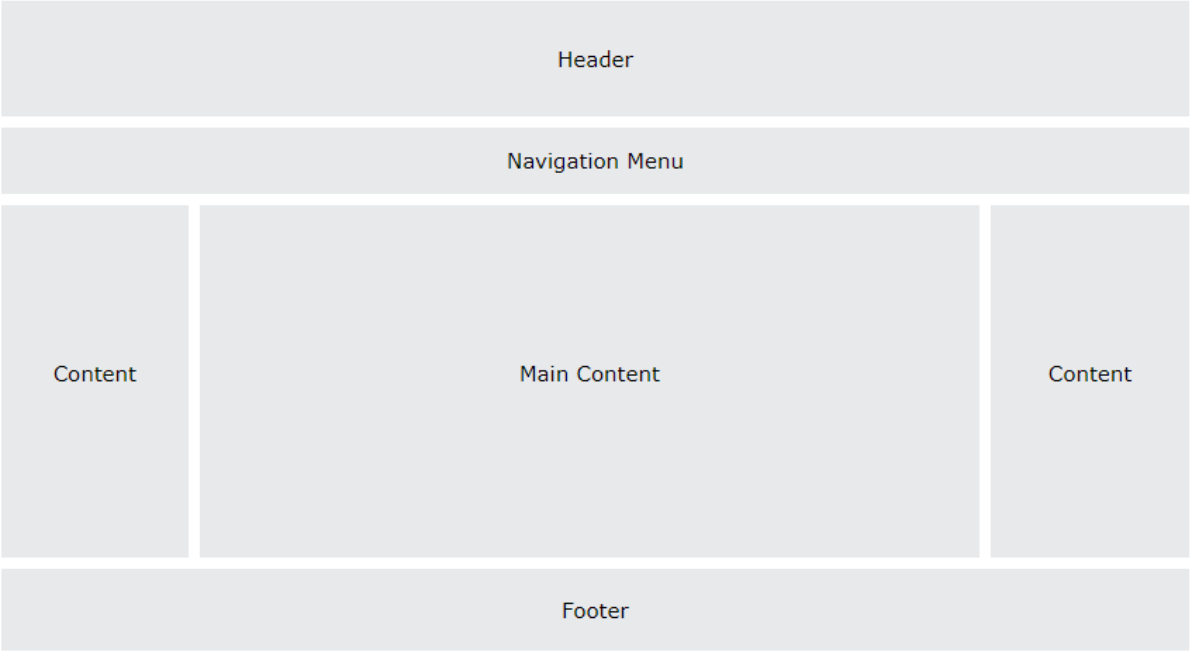
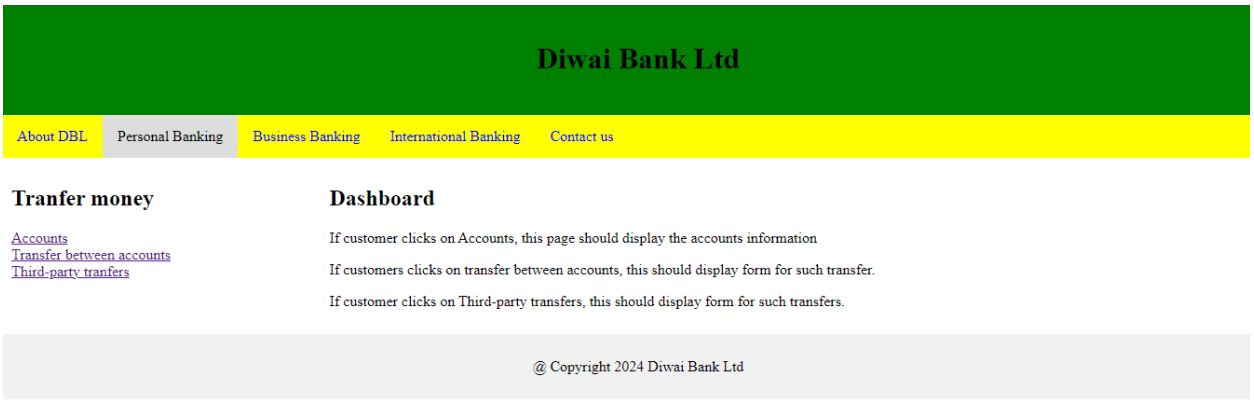
AT2: Lab 1
Weighting: 5%
Due date: Fri 8 March 2024 (5pm)
IS312 Web Application Development
Bachelor of Information Systems
Dr Martin Daniel (PhD)

1. This Lab provides an opportunity for you to apply your knowledge and skills of HTML and CSS to create a website interface.
2. A website is often divided into headers, menus, content and a footer. CSS Grid Layout is a two-dimensional layout system that allows you to create complex grid-based layouts with rows and columns. It provides a more sophisticated and powerful way to structure and position elements on a web page compared to traditional methods. Grid layout offers various features like grid lines, grid gaps, named grid areas, and more, making it a versatile tool for creating sophisticated and responsive layouts on the web.



3. Use CCS Grid Layout to create a website interface that looks like the one below.
    a. Use CSS to style the navigation menu, content sections, header and footer.
    b. Define the CSS styles in an external CSS file.
    c. Link the CSS file and use the styles in the HTML document to style the interface below.



4. Ensure the quality of your code.
    a. In the head section, provide some information about yourself as the author (name, date of creation, what the code is about).
    b. Indent your code appropriately.
    c. Insert relevant comments as required and appropriately.
5. Submit your HTML and CSS files via the submission link on the unit page on Moodle before 5pm on Friday 8 March.
